

Foundation 02 — Nutrition

SECTION 01 — WHAT IS NUTRITION

Nutrition is the foundational fuel system for every result you pursue. It determines your energy, your recovery, your hormone balance, and your physical composition. Convenience and habit have displaced intentional eating for most people — and the result is degraded output across every other Foundation.

Learning to eat with purpose is not complicated. It requires knowledge, consistency, and the willingness to move against normalized habits. You do not need to be perfect. You need to be intentional.

Fitness creates the stimulus. Nutrition determines whether that stimulus produces results.

SECTION 02 — WHY NUTRITION MATTERS MORE THAN MOST REALIZE

Most people treat nutrition as a secondary concern — something to think about after the workout is done. This is a critical error. Nutrition is not a complement to fitness. It is the system that makes fitness produce results.

Without proper nutrition, training creates demand but cannot fulfill it. Surface-level improvements at best — minor health-marker changes, negligible physique shifts, and energy that fluctuates without reason. When nutrition is dialed in, everything else compounds.

SECTION 03 — CORE COMPONENTS

Total Calories (Kcals)

Your daily energy target required to support metabolic health and activity level. Total caloric intake determines whether you are in a surplus (building), deficit (losing), or maintenance state. Everything else operates inside this number.

Macronutrients

The three primary categories of nutrients your body uses for energy and structural repair: protein, carbohydrates, and fat. Every food you eat is a combination of these three in varying ratios.

Protein — 4 kcal/g

Essential for muscle repair, growth, and recovery. The International Society of Sports Nutrition supports daily protein intake of 1.4–2.2 g/kg of body weight for most active individuals. Acute doses of 20–40g of high-quality protein distributed every 3–4 hours maximize the anabolic response — especially when timed near training sessions.

Carbohydrates — 4 kcal/g

Your body's primary energy source for movement and cognitive function. Carbohydrate timing and quality directly affect training performance, blood sugar stability, and mental clarity. Prioritize complex, whole-food carbohydrate sources over processed alternatives.

Fats — 9 kcal/g

Critical for hormone production, joint health, cellular function, and long-term sustained energy. Do not eliminate dietary fat. Prioritize quality sources — avocado, nuts, olive oil, and fatty fish — over processed seed oils and trans fats.

Micronutrients & Fiber

Vitamins and minerals enable the body to process and utilize macronutrients effectively. Fiber supports gut health, blood sugar regulation, and satiety. A micronutrient-rich diet built on whole foods reduces the need for supplementation.

Supplements

Used to address specific gaps or provide a practical substitute when whole-food options are unavailable. Supplements do not replace food — they fill identified deficiencies. Common performance-relevant supplements include creatine, vitamin D, magnesium, and high-quality protein powder.

SECTION 04 — ULTRA-PROCESSED FOODS

Ultra-processed foods (UPFs) are industrial formulations designed for palatability, not nourishment. They are engineered to override your body's natural satiety signals. Research consistently links high UPF consumption to

elevated risks of metabolic disease, chronic inflammation, disrupted gut health, and body composition deterioration.

Shifting away from UPFs stabilizes blood sugar and insulin. Within 7–14 days of meaningful reduction, most people experience fewer inter-meal hunger episodes, improved energy, and reduced cravings. This is not willpower — it is biochemistry.

Eat foods that were grown, raised, or caught. If it was manufactured in a facility with a 30-ingredient label, question it. Food companies and healthcare companies are more interested in your dollar than your health.

SECTION 05 — THE JPG NUTRITION STANDARD

There is no single required diet inside Jones Performance Group. There is a standard:

- Eat with intention — every meal is a decision about your performance and your identity
- Prioritize protein at every meal to support recovery and satiety
- Minimize ultra-processed foods, added sugars, and empty-calorie intake
- Hydrate consistently — minimum half your body weight in ounces daily
- Track your intake honestly during the baseline phase — data over guessing
- Eat to perform, not to cope

SECTION 06 — HOW NUTRITION CONNECTS TO THE OTHER FOUNDATIONS

Fitness	Proper protein and carbohydrate timing directly amplifies training adaptation and recovery speed.
Sleep	Blood sugar stability from quality nutrition improves sleep onset and deep sleep quality.
Mental / Spiritual Health	Micronutrient-rich eating supports brain chemistry, mood regulation, and stress resilience.
